Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the

application:

Listing of Claims:

1.(original) A method for reducing fringe fields from a perpendicular write head having

an air bearing surface, a write pole with a length and a first width, a leading shield, and

a return pole with a second width, comprising:

tapering said write pole so as to have increasing width in a direction away from

the air bearing surface;

symmetrically locating a trailing shield, whose bottom surface is coplanar with the

air bearing surface at a first distance behind said write pole;

at second distances from opposing edges of the write pole, placing a pair of side

shields that contact said trailing shield, that have bottom surfaces coplanar with the air

bearing surface, said side shields having opposing outer edges separated by an amount

equaling said second width, whose widths exceed said the write pole length by an

amount; and

magnetically connecting said side shields to said return pole.

2. (original) The method recited in claim 1 wherein said write pole first width at the air

bearing surface is between about 0.05 and 0.4 microns.

2

Appl. No. 10/828,888

Reply to Office action of 04/09/2007

3. (original) The method recited in claim 1 wherein said return pole second width is between about 10 and 50 microns.

- 4. (original) The method recited in claim 1 wherein said first distance, between write pole and trailing shield, is between about 0.02 and 0.2 microns.
- 5. (original) The method recited in claim 1 wherein said trailing shield has a thickness between about 0.05 and 0.4 microns.
- 6. (original) The method recited in claim 1 wherein the tapering of said write pole is at an angle of between about 15 and 65 degrees, relative to the vertical.
- 7. (original) The method recited in claim 1 wherein said tapering of the write pole begins at an edge that is closest to a trailing edge.
- 8. (original) The method recited in claim 1 wherein said tapering of the write pole begins at an edge that is closest to a leading edge.
- 9. (original) The method recited in claim 1 wherein each side shield has a width between about 0.2 and 5 microns.

Reply to Office action of 04/09/2007

10. (original) The method recited in claim 1 wherein said second distances, between each of said side shields and said write pole, is between about 0.02 and 0.2 microns.

- 11. (original) The method recited in claim 1 wherein each side shield is between about 0.05 and 5 microns from said leading shield.
- 12. (original) The method recited in claim 1 wherein each side shield has a thickness between about 0.05 and 0.4 microns.
- 13. (original) The method recited in claim 1 wherein said return pole has a thickness between about 0.5 and 5 microns.
- 14. (original) The method recited in claim 1 wherein said write pole length is between about 0.1 and 0.5 microns.
- 15. (original) The method recited in claim 1 wherein said amount by which the side shield width exceeds the write pole length is up to about 0.2 microns.
